WITH Taiwanese hepatitis C virus genome: sequence determination from mapping the 5' termini of viral genomic and antigenomic RNA.";

WINDLOYD 188:102-113(1992)

C -!- FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function and NS5 may play a role in the viral RNA replication.

C -!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein, commonly with Asp or Glu in the P6 precursor polyprotein of this virus is a nucleocapsid covered (RNA)(N).

C -!- SUBUNIT: The virion of this virus is a nucleocapsid covered lipoprotein M and glycoprotein E. The nucleocapsid is a complex protein M and glycoprotein E. The nucleocapsid is a complex protein C and mana. P29946;

The envelope consists of two protein protein M and glycoprotein E. The nucleocapsid is a comple protein C and mRNA.

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Genome polyprotein E1 (G932) (G935); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.21.9); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3.4.21.98); Nonstructural protein NS54 (P4); Nonstructural protein NS48 (P27); Nonstructural protein NS54 (P56); Nonstructural protein NS54 (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.3.48)).
Hepatitis C virus (isolate 1) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              P26664;

-i- PUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function and NS5 may play a role in the viral RNA replication.

-i- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the catalytic active the process of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of the control of t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
      C:- FUNCTION: PROTEASE NS2 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

C:- FUNCTION: PROTEASE NS3 IS RESPONSIBLE FOR THE CLEAVAGE OF NS2-NS3.

C:- FUNCTION: NS4A FOLKS, NS4B-NS5A AND NS5A-NS5B.

C:- FUNCTION: NS4A FOLKS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE CURVATION OF NS3.

C:- FUNCTION: NS5A SEEMS TO HAVE A TRANSCRIPTIONAL ACTIVATORY ROLE.

C:- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN SEEMSTAL ROLE IN THE VIRUS REPLICATION.

C:- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

C:- FUNCTION: NS5B IS A NUA-DEPENDENT RNA POLYMERASE THAT PLAYS AN ESSENTIAL ROLE IN THE VIRUS REPLICATION.

C:- FUNCTION: NS5B IS A RNA-DEPENDENT RNA POLYMERASE IN THE PLAYS AN ESSENTIAL ROLE IN THE VIRUS SEPONDED E N A DEPENDENT RNA PLAYS AN ESSENTIAL ROLE IN THE VIRUS OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1

C:- FYN: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1

C:- FYN: THE NUCLEOCAPSID IS A COMPLEX OF PROTEINS: E1

C:- FYN: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.

C:- SIMILARITY: THE NS2 PROTEASE BELONGS TO PEPTIDASE FAMILY U39.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. NS3 and NS5 may play a role in the viral RNA replication. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        {RNA}(N).
SUBUNIT: The virion of this virus is a nucleocapsid covered lipoprotein envelope. The envelope consists of two proteins: protein M and glycoprotein E. The nucleocapsid is a complex protein C and mRNA.
SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY S29.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      moved. -!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUS SPECIFICITY: Expressed by the liver and
-!- DOMAIN: Composed of two homologous domains.
-!- SIMILARITY: Belongs to the transferrin family.

Virology 173:291-301(1989)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       FUNCTION: The small proteins NS2A, NS2B, NS4A and NS4B are hydrophobic, suggesting a possible membrane-related function. NS3 and NS5 may play a role in the viral RNA replication. CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viprecursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'. CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     {RNA}(N).
SUBUNIT: The virion of this virus is a nucleocapsid covered lipoprotein envelope. The envelope consists of two proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       375:291-298(1995).

-i- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE MUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA (BY SIMILARITY).
